SYNTHETIC DEMO DOCUMENT · not a real institutional document, no patient data

# CHIP-AML22 · Amendment 2 (SYNTHETIC demo)

Synthetic amendment generated for a hackathon demo · not an actual protocol amendment

## Amendment 2 to CHIP-AML22 (SYNTHETIC) · Summary of changes

This synthetic amendment is a demo document. It modifies section 9.2 'Hyperleukocytosis' of the master protocol for demonstration purposes only.

Change 1 ? Definition: hyperleukocytosis is now defined as a white blood cell count above 80 × 10?/L (previously 100 × 10?/L). Patients between 80 and 100 × 10?/L are managed with the same precautions as above 100 × 10?/L.

Change 2 ? Leukapheresis: leukapheresis is no longer recommended routinely; it may be considered only for symptomatic leukostasis after discussion with the national coordinator.

Change 3 ? Transfusion: packed red cell transfusion is withheld until the white blood cell count is below 50 × 10?/L unless the patient is symptomatic from anaemia; platelets are transfused liberally to keep the count above 30 × 10?/L during cytoreduction.

## Rationale and implementation

Rationale (synthetic): registry data suggested leukostasis events below the previous threshold. Implementation: effective at each site after local ethics committee notification. Training: a 15-minute briefing for prescribers. Version 2.0 of the amendment, dated 2026-10-01 (synthetic).
